

An app that optimizes and fixes users dating profiles on apps like hinge and tinder so they attract the people they are looking for.

The Killer Feature: Match Targeting

Instead of just fixing a profile, the app asks:

"Who are you trying to attract?"

Example options:

- ambitious professionals
- creatives
- outdoorsy people
- intellectual / curious types
- playful / adventurous personalities

Then the app **rewrites the profile to attract that specific type of person.**

Generic profile → generic matches.

People complain about:

- wrong types of matches
- low-quality matches
- mismatched personalities

But the real issue is:

their profile attracts everyone.

Then chooses target partner traits like:

- intellectual
- emotionally mature
- funny
- adventurous
- career-driven

The AI then:

1. Suggests better prompts

2. Suggests better photos and order to put them in

3. Adjusts tone

4. Removes signals that attract the wrong people

Example transformation:

Before

"I like traveling, trying new restaurants, and hanging with friends."

After (for intellectual / curious matches)

"Currently obsessed with figuring out why certain cities feel instantly alive while others don't. Also always hunting for the best late-night food spot."

"Attract the right matches."

Profile Alignment

or

Match Calibration

Keep these things in mind when building ai background

The three types of dating profiles that get the most matches on Hinge/Tinder (psychology-wise).

Almost everyone falls into one of them — and two of them perform way better than the others.

1. The High-Signal Profile (Best Performing)

Typical traits:

- Specific interests
- A clear vibe or personality
- Good candid photos
- Prompts that reveal how they think

Example bio:

"Currently trying to master homemade pasta and the perfect espresso. If you know a better late-night pizza spot than I do, I'm open to being proven wrong."

2. The Safe / Generic Profile (Most Common)

Typical traits:

- Travel photos
- Group photos
- Very neutral bios

Example bio:

"Love traveling, good food, and hanging out with friends."

Why it underperforms:

- Everyone says this
- No personality signal
- Hard to start conversations

3. The Entertainment Profile (High Match Rate but Polarizing)

Typical traits:

- Humor
- Bold statements
- Unique prompts

Example:

"I will judge you based on your favorite dinosaur."

Why it works:

- Stops scrolling
- Creates instant conversation
- Shows personality

For the ai output keep these things in mind...

What Actually Performs Best

High-Signal + Light Humor

That combination gives:

- personality
- approachability
- conversation hooks

Example:

"Recovering perfectionist learning how to relax. Current hobbies include finding the best croissant in NYC and losing arguments to my dog."

The algorithm and users reward **profiles that create curiosity**.

Not perfection.

People swipe when they think:

"I want to know more about this person."

Profiles that try to look **perfect** actually perform worse than profiles that feel **human and specific**.

People trust authenticity more than polish.

7 most common mistakes that almost everyone makes.

1. The "Generic Human" Bio

Example:

"I love travel, good food, and spending time with friends."

The issue:

- Every human likes those things.
- It tells someone **nothing about you**.

Better version:

"Currently on a mission to find the best dumpling spot in the city."

Specificity creates **personality signals**.

2. Too Many Group Photos

Good rule:

- Photo 1: just you
- Photo 2: activity
- Photo 3: social
- Photo 4: personality

3. Low-Energy Photos

Common examples:

- sunglasses
- far away shots
- expressionless selfies
- bad lighting

Photos where you're:

- laughing
- talking
- mid-activity

4. Trying to Look Perfect

Example:

"Entrepreneur, investor, traveler."

Better:

"Recently attempted to learn surfing and discovered I have the balance of a baby giraffe."

5. No Conversation Hooks

If someone matches with you and doesn't know what to say, the conversation dies.

Good prompts include **built-in hooks**.

Example:

Bad:

"I like music."

Good:

"I will defend 2000s pop music forever."

Now someone can respond.

6. Negative Prompts

"No drama."

"Don't waste my time."

"If you're boring swipe left."

7. Mismatched Photos

Example set:

- professional headshot
- party photo
- gym mirror selfie
- hiking picture

These may be good photos individually, but together they send **confusing signals**.

Additional Outputs

Example output:

Profile Score: 63/100

Issues detected:

- Generic bio
- Low-energy first photo
- No conversation hooks

Suggested fixes:

- Rewrite prompt #2
- Move photo #4 to position #1
- Add personality signal

Match Performance Tracking: show users how their profile is **performing over time**.

Example:

Profile Score: 78 / 100

Match Rate: +32% this week

Conversation Starts: 6

Then suggestions:

- Your first photo is performing well
- Prompt #2 is getting low responses
- Try swapping photo #3 with a smiling photo

Example User Flow

1. User uploads profile
2. App analyzes photos, prompts, and tone
3. User gets a **Profile Score**

Example breakdown:

Category	Score
Photo Quality	82
Personality Signal	65
Conversation Hooks	58
Attractiveness Signals	74

Then the app suggests improvements.

After changes, the user can check their dashboard:

"Did my profile improve?"

Show

- estimated match increase
- profile strength compared to others
- before/after analysis

Make the app about **optimization over time**

Examples:

- profile score updates

- “photo performance” insights
- weekly improvement suggestions
- match feedback tracking

“Attraction Signals”

analyze what signals the profile sends.

Example output:

Your profile currently attracts:

- adventurous personalities
- casual daters
- extroverts

But you said you want:

- intellectual types
- emotionally mature partners

Specific Instructions to provide users with:

Example instead:

- “Move photo #4 to position #1.”
- “Remove group photo #2.”
- “Rewrite prompt #3 like this.”

Profiles need to sound:

- natural
- slightly imperfect
- human

Users need to believe the tool will produce **more matches**.

So the messaging must always tie back to outcomes:

- better matches
- higher response rates
- attracting the right people

Step 1

Analyze profile

Step 2

Show **score + problems**

Step 3

Offer **fixes**

Step 4

Track improvements

That creates a **feedback loop**.

The biggest improvement in Photos

Photo ranking part

Example output:

Photo #3 will likely perform 42% better as your first photo.

"Profile strategy."

Helping people understand:

- what signals they send
- who they attract
- how to adjust it

Target demographic:

1. High-Functioning Professionals (Ages ~28–40)

Think:

- lawyers
- consultants
- finance people
- tech workers
- founders

- doctors
- MBA / grad students
- ambitious corporate professionals

2. Recently Single After Long Relationships

People who:

- were married or partnered for years
- suddenly re-enter dating apps
- feel completely lost

The branding should feel:

- intelligent
- strategic
- slightly premium

"Dating profile strategist."

Less:

"Fun profile generator."

The core audience would likely be:

28–38 year olds

Include an option for a "Profile Roast / Audit"

People upload their dating profile and the app gives them an **honest analysis**.

Example output:

Dating Profile Score: 61 / 100

Breakdown:

- Photo quality: 72
- Personality signal: 48
- Conversation hooks: 39
- Attractiveness signals: 67

Then it explains **why**.

Example feedback:

- Your first photo is low-energy (neutral face, indoor lighting)
- Prompt #2 is generic and doesn't create conversation
- Two of your photos send conflicting signals (professional vs party)

Then it gives a **rewritten version**.

It should feel:

- witty
- slightly teasing
- but still helpful

Example feedback style:

Instead of:

"Your bio lacks specificity."

Say:

"This bio could belong to 4.7 million people on this app."

The Viral Loop

The loop would look like this:

1. User uploads profile
2. Gets a **score + roast**
3. Shares result on TikTok
4. Others try the tool

No paid ads needed initially.

With this as the payment structure

Step 1

Launch with:

Free profile analysis

Step 2

Offer:

\$19 "Full Profile Optimization"

No subscription.

"The Dating Profile Audit."

Simple concept: optimizing a **dating profile**

- upload profile
- get score
- improve matches

The Core Product Message

"Dating apps reward good profiles. Most people build theirs wrong."

Then the product is the solution **a diagnostic tool**, not just a writing tool.
